

TALL FESCUE

APPLICATION

Tall Fescue is ideal for those wanting a lower maintenance grass that will get a moderate amount of traffic.

COLOR & TEXTURE

Medium to dark blue-green color. Medium blades with high density and excellent leaf uniformity

SOIL TYPE

Grows well in all types, from heavy clay to sandy soils. Displays an above average tolerance to acidic, alkaline, saline and poorly drained soils.

MOWING

Mow to a height of 1.5 to 2.5 inches. Frequency is once to twice a week.

WATERING

To avoid dry out, all newly planted Tall Fescue turf should be watered daily and soaked thoroughly to a depth of 3 inches for the first 10 to 14 days. After that initial period, water deeply and infrequently whenever grass is showing signs of dehydration.

FERTILIZATION

00.1 to 0.5 pounds of actual nitrogen per 1,000 sq. ft. per growing month. Needs less phosphorous and potassium. Avoid nitrogen applications during hot, dry months (July through August) because this will increase plant demands for water. A good rule of thumb is to apply *slow release fertilizers* around the holidays (i.e. Easter, Memorial Day, Independence Day, Labor Day and Halloween). Apply iron in the summer to keep a deep green color. Good balanced fertilizer is 21-14-5-3F or 20-10-10-3F. Use a good winterizer for the Halloween application.
